

Echelon® Herbicide

Warm Season Turfgrass Including St. Augustinegrass

Groundbreaking Preemergent Herbicide Technology

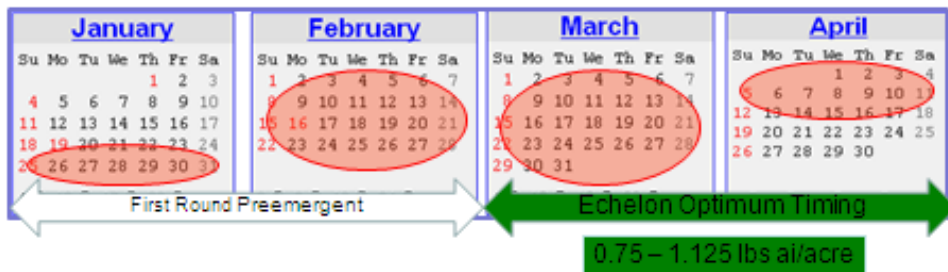

- **Echelon attacks the entire weed.** Echelon is the first preemergent herbicide with dual mode of action that prevents weeds from absorbing nutrients and converting energy into new weed growth.
- **Echelon provides long residual preemergent crabgrass and goosegrass control** and is the first herbicide of its kind to provide **early postemergent control of both crabgrass and goosegrass** (up to 4-leaf)
- **Echelon is the first preemergent herbicide to also provide preemergent control of yellow nutsedge and kyllinga** for at least 100 days after application
- **Echelon saves you time and money.** Echelon does more work in a single application, saving you labor, time and chemical costs at your next scheduled application.

*1-4 leaf at application

Optimum Application Timing and Use Rates

For maximum residual preemergent crabgrass, goosegrass and nutsedge control, apply Echelon from March 1 through mid-April at rates labeled for your turf types. Emerged crabgrass and goosegrass in the 1 - 4-leaf stage will be also controlled with this Echelon application.
